Types of finishes - as sprayed - cut & flash - wood or plastic float - steel float - carved

Types of finishing to sprayed concrete -

as sprayed - cut & flash - wood or plastic float - steel float - carved

As sprayed finish - dry spray (gunite)

As sprayed finish - wet spray (shotcrete)

As sprayed finish - dry spray (refractory)

The typical concrete finish produced by both wet spray (shotcrete) and dry spray (gunite) is an open textured coarse finish sometimes described as 'orange peel' in appearance. When concrete is sprayed onto any surface the impact bond is of utmost importance for good adhesion, especially in overhead spraying situations. Less working by trowel yields the highest possible bond strengths and mitigates against de-lamination. An 'as sprayed finish' is the most cost effective surface finish where structural integrity is considered more important than surface aesthetics.
